

CIPHERSIM

Defend Your Data, Protect Your Identity, Outsmart the Threats

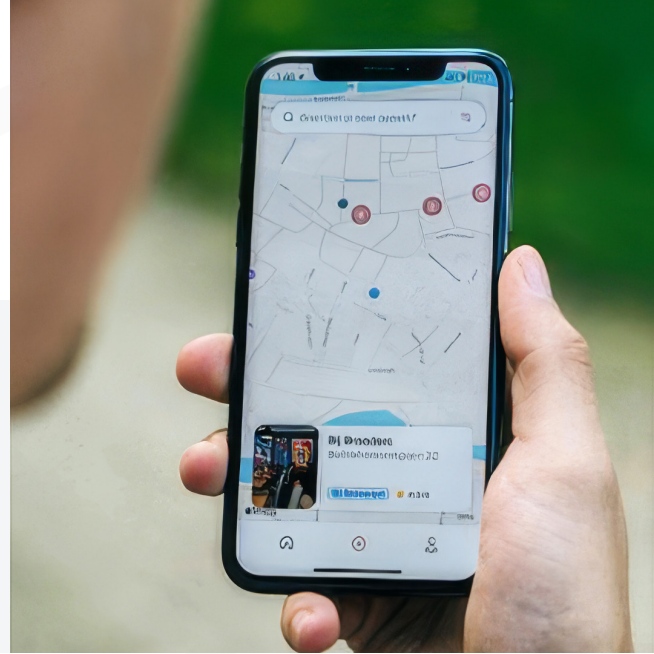

SIMPLY THE MOST SECURE MOBILE NETWORK.

Our global, data-only SIM card protects your identity by seamlessly blending you in with some of the largest mobile network operators in the world.

No ID checks, no phone numbers tied to network identity, and rolling IMSIs from multiple International Mobile Subscriber Identity (IMSI) number sponsors significantly raise the bar and costs for adversaries to target our users.

About Us

We are telecom network security experts. Our experience ranges from operating large mobile networks to building the most lethal offensive cyber capabilities for the USG. We've pen-tested commercial telcos and led cellular geolocation operations. Our extensive knowledge is baked into CipherSIM, making it the most capable, protected SIM offering ever.

No other network provides the same level of access, depth of protection, ease of use, and flexibility for customer missions.

 **Advanced Firewall** - Our custom signaling firewall not only protects users from SS7 and DIAMETER signaling attacks, but also sends alerts to the user and any account admins so that appropriate defensive actions can be taken. No other company comes close to our expertise in this arena.

 **Command Center** - Provision new users, assign resources, cycle IMSIs, manage virtual MSISDNs, and manage/oversee/locate/track your fleet from your own private CipherSIM Command Center instance. Soon, users will also be able to automate tasks from this easy-to-use interface.

 **Real Mobile Numbers** - Mobile numbers from REAL mobile network partners from across the globe allow you to blend in with their subscribers, NOT ours. Numbers are used for safely sending/receiving SMS and 2FA to create accounts (Signal, WhatsApp, etc.) but they will not show up in Call Detail Records.

 **Flexible Features** - We can bundle with commercial mobile endpoint security, MDM, and VPNs. CipherSIM can route traffic to private networks, and allow for configurable data egress paths. Our app can enable admins to see granular device location if serving cell tower location is not enough.

 **Blended IMSIs** - While competitors may also allow for IMSI rolling, their IMSIs come from one pool that is linked to their operator. CipherSIM utilizes multiple IMSI sponsors in multiple countries so that CipherSIM users carry the signature of those large operators (not CipherSIM).

CipherSIM:

- Stops adversaries from tracking you.
- Conceals patterns of life.
- Provides continuous threat monitoring with automatic attack blocking / alerts.
- Protects against network & device vulnerabilities.
- No call detail records generated.
- Works on iOS or Android devices.
- Physical SIM cards or eSIMs available.
- Safeguards your devices, preventing device compromise.
- Secure cost-effective global data connectivity.
- Provides network reliability and redundancy.
- Seamlessly connects multiple mobile operators and public and private networks.
